### BIO

Kayla is a Personal Trainer that has many clients. She tries to prep her own meals, but with her busy schedule, it is hard to cook all the time. Thanks to her good genetics she is allowed to eat out and keep her figure. She tries to balance out her diet by selecting the healthiest choice at every restaurant she visits. But she loves food to much to restrict herself from trying out new and different types of foods. She averages 2 meals a day with some snacks because of her packed schedule.

### Scenario

It is 2:05pm. Her 2pm client finally calls and says he cant make it. Her next client is at 3:30 and she normally only has time for a snack between clients. Now she has an 1hr and 25 mins to get lunch. Her old friend is in town and texts her to see if she can grab a quick lunch. Her friend says yes but they are 35 mins away from eachother.

### Task

Kayla needs to find 2-3 restuarant options to suggest that are around the half way point between her and her friend so that they both only have to drive 15-17 minutes to meet eachother. Accounting for the time needed to drive back to work, they will only have around around 50 minutes to order and eat. The more time she spends on the app looking for restaurants, the less time they have to spend together.
